

## PRIZE UP FOR GRABS!

As this is the 24<sup>th</sup> edition of 'The Wet Moor', and hence it has been going for 2 years, I thought this month we would have a look back at some of our previous articles. I decided we could do this in the form of a quiz, whereby I will ask some questions related to these, and some attentive reader could win a prize. All the answers can be found by looking back at the previous magazines assuming, of course, that you do not remember them!

- 1) What temperature should a tortoise be kept at during hibernation?
- 2) What garden pests carry and transmit lungworm to our pet dogs?
- 3) Name a disease of rabbits that can be protected against by vaccination?
- 4) What sort of chips should you give your pet?
- 5) Name 2 diseases that an obese pet is more likely to develop?
- 6) What type of chocolate is most poisonous to pets?
- 7) On average, how long does an adult flea live?
- 8) What disease, that dogs catch from rats, causes jaundice?
- 9) On average, what % of a pet's body is made up of water?
- 10) Name a parasite that your pet is more likely to pick up in the autumn?

Please either e-mail your answers to me, Jon Power, at [jonpower@somertonvets.co.uk](mailto:jonpower@somertonvets.co.uk), or post them to me at The Old Band House, West St., Somerton, TA11 6NB. The winner will be the one with the most correct answers, or, in the case of a tie, the first of these to be drawn out of a hat. Closing date for entries is Thursday February 28<sup>th</sup> at 5pm. And now for the important bit, the prize! This will consist of 2 bottles of wine for the clever reader and a packet of flea and worm treatment for their pet. Good luck!
